

If you ordered the Large version of the keypad and find it uncomfortable to reach all of the buttons, you may need to switch to the Medium version. This is achieved by changing the rails or bottom metal plate from Large to Medium, depending on the keypad version.

1. Unplug the Azeron keypad

2. Unscrew the 3 recessed screws and lift off the palm rest

3. Look for sticker with QR code.

## Keypad version.

On the QR sticker you should see a VIN code.

You should look for the V, which shows the metal plate version. Keypads with V7 and lower will require rail change.

Keypads with V8 and above will require a metal plate change.

## V7 and below.

You will require a set of Medium rails as you have large ones on the keypad.

1. Remove towers from rails by unscrewing screws marked with red circles.
2. Remove rails from metal plate by unscrewing the screws marked with yellow circles.
3. Put new rails and re-assemble the keypad in reversed steps.

## V8 and above.

You will require a medium metal plate as you have large metal plate fitted.

1. Remove rails from the metal plate by unscrewing screws marked in yellow.
2. Then remove the metal plate from the keypad by unscrewing screws marked in red
3. Put new metal plate and re-assemble the keypad in reversed steps.
